Application No.: 09/838,384

Applicants: Guy-Ho CHA, et al.

1 (amended). A liquid crystal display device, comprising:

2 a display unit for displaying an image;

a back light assembly including a light source for generating a light, a light guiding plate installed at a side of the light source so as to uniformly radiate the light generated from the light source into the display unit and a light focusing means installed above the light guiding plate so as to focus the light transferred through the light guiding plate to a surface of the display unit; and a mold frame having a first frame for receiving the display unit, the light guiding plate and the light focusing means, and having-a second frame for receiving the light source, the second frame configured for installation in the first frame such that the extremities of the second frame are within the periphery of the outer portions of the first frame.

4 (amended). The liquid crystal display device as claimed in claim 1, wherein the first frame includes a bottom surface, side walls that are vertically formed at side peripheral portions of the bottom surface except for one side peripheral portion of the bottom surface, and a supporting member installed at the side peripheral portion of the bottom surface[,] in which the side wall is not formed, so as to support the second frame, the second frame being installed in an inner side of the supporting member, the supporting member having an upper surface that is corresponding to an upper surface of the side walls installed[in] perpendicular to the second frame.

10 (amended). A container module, comprising:

a first frame for receiving a display unit, said first frame including a bottom surface and side walls vertically formed at all side peripheral portions of the bottom surface[but]except for one side peripheral portion of the bottom surface; and
